

SOFTWARE QA TESTING

Customer expectations of flawless execution have become par for the course. And rightly so, because in today's competitive economy, no software vendor can afford the tarnished reputation or unhappy customers that result from preventable software defects.

But when it comes down to traditional methods for assuring software quality, companies are finding it increasingly difficult to give up the valuable time and strategic focus that get consumed by resource-intensive internal test efforts – a problem that grows larger as development projects advance in both scope and complexity.

It's no surprise then that many companies are turning, with increasing popularity, to outsourced methods of software quality assurance as a way to ensure the integrity of their products, the satisfaction

of their customers, and the long-term success of their growing development initiatives, all while keeping costs down.

Look to Comspec for a complete solution to your software quality needs. We handle the software testing process on a wide variety of corporate global development projects, ranging from small pre-release test cycles to some of the largest, most complex later stage application releases with full localization support.

At Comspec, we realize that the software quality assurance (SQA) process is one of the most important in the software development life cycle. Our carefully selected teams assure quality by applying meticulous and repeatable methods to the testing of your software. Because only quality software can hope to compete in today's market.

Key Benefits

Like most any product, if customers are dissatisfied with something they've purchased from a software vendor, they're likely never to recommend that product nor buy from that software vendor again. Bugs and defects, in addition to seriously hampering an application's functionality, look sloppy and unprofessional, and reflect poorly on a company's reputation.

Because the process of software quality assurance (SQA) is designed to "search-and-destroy" software defects and inefficiencies, projects that incorporate rigorous, objective testing methods will find that development costs are significantly reduced – because all later stages of the development life cycle become streamlined and simplified.

It's no secret that bug-infested applications are troublesome to support. The combined cost of unnecessary recalls, returns, and patches can be frightful. And that says nothing of what is spent on ongoing customer support, be it by telephone, email, or in person. All these costs and more can be dramatically reduced by releasing only rigorously quality-assured products.

Key Features

Understanding your specific methods and requirements allows us to facilitate the delivery of quality software, on time – repeatedly.

Our teams are dedicated to the task of minimizing quality-related costs. After all, it makes better business sense to prevent, discover, and fix software defects than to deal with the consequences of shipping or going live to customers with a defective product.

Our outsourced approach to SQA will eliminate the hassles and inefficiencies of performing testing in-house. So you can save yourself cost and peace of mind by delegating all the countless QA responsibilities like developing test plans, hiring and training test teams, prepping the testing environment, analyzing defects, and coordinating the test effort to trained quality professionals.

Methods and Tools

What's more, outsourcing SQA to an independent, unbiased contractor is the best way to achieve the objectivity that your project needs. Our independent test teams are uninfluenced by internal pressures, priorities, or agendas, which makes their complete objectivity a certainty. Our priority is ensuring that our clients release quality software – on time, every time.

Our approach is totally flexible, so you get the level of service you need, when and where you need it. Our agile working environment enables us to meet the unique needs of the international community and the immediate needs of complex multi-region and multilingual projects. So whatever your requirements, Comspec has you covered.

At Comspec our focus is eBusiness, with a specialized testing concentration in the area of online development initiatives. This focus translates into the high standards and quality services we deliver with unfailing consistency.

Our software test lab houses a number of servers and computers on a variety of platforms. And our high-bandwidth connections allow us to test your product in as many environments as required.

Comspec is a trusted service provider backed by over 25 years in the communications and high technology industries. We've been testing application quality for years, and have leveraged this experience to develop a thorough and highly flexible quality assurance approach.

We will develop a comprehensive test plan custom-tailored to your application's needs, or, if your plan is already laid out, our quality experts will work with you to execute it in a meticulous and time-conscious fashion.

Let us help you deliver greater client value at a lower cost by contacting us today.
